

MACROS

by OLISAILS

PERFORMANCE CRUISING, CLUB RACES, ONE DESIGN

MACROS is a technologically advanced laminate made using a process of pressure, vacuum and high temperatures.

MACROS is a construction system making it possible to create sail sections designed and made to measure through the lamination of two films, within which are distributed the fibres aligned with the loads created over the surface of the sail.

MACROS makes it possible to make sails using extremely low-stretch fibres. The trajectories of the fibres are curved in order to align themselves with the sail's loads and so assure a better shape than sails made from panels.

MACROS maintains an excellent shape for the sail over time, thanks to the optimal position-ing of the fibres.

MACROS is light because the density of the fibres supporting the primary loads is variable throughout the whole sail.

MACROS is versatile because it is possible to use various types of fibres, with film on film external surface or, in the Touring version, with double protective taffeta for cruising sails.
